The AI successfully navigated through the NGPF Bank Simulator, launching the simulator, dismissing the welcome dialog, and exploring account activity details. It then expanded the Accounts section and verified the availability of account activity information, confirming the presence of relevant account details. This partial workflow demonstrates reliable simulator access and step-by-step navigation to inspect key account information.

Step-by-Step Walkthrough

1. Bank Simulator Homepage

The AI loads the NGPF Bank Simulator homepage, presenting an overview and options to start or continue a session.

<https://www.ngpf.org/bank-sim>

2. Simulator Launch with Welcome Dialog

The simulator launches and the AI encounters a welcome dialog, indicating entry into the bank simulation environment.

<https://www.ngpf.org/bank-sim/home?returnUrl=%2F>

3. Accounts Section Expanded

The AI expands the 'Accounts' section in the sidebar navigation to reveal available sub-items, preparing for deeper account inspection.

Discovered Test Scenarios

#	Scenario	Type	Priority
1	Discovered Workflow: Bank Simulator Account Navigation -- Partial	partial_flow	high

Discovered Workflow: Bank Simulator Account Navigation -- Partial

Partial test covering navigation through the bank simulator up to account activity inspection

A user lands on the NGPF Bank Sim site, launches the simulator, dismisses the welcome dialog, expands the accounts section, views account activity, and attempts to check for the presence of a specific account ID. The workflow is blocked due to missing account data required for verification.

- Use `waitForSelector` for dialogs before clicking.
- For web component parents present in selectors, use `'pressSequentially()'` where needed.
- Ensure that page navigation waits for DOM content loaded before taking further actions.
- When searching for account ID, check presence with page assertions (do not proceed unless found).
